                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       herbicides
                                                                                                                                                                   AAW04268
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2002-269010/31
                                                                                                                                                                                                                                                                                                         346

Rafal seed pods is useful for controlling dehiscence. Manipulation of the enzyme's activity can influence the timing of dehiscence. A cDNA clone (AAT33994) coding for the PG was isolated from a cDNA library of the rape seed pod dehiscence zone. PG nucleic acids (partic. antisense) can be used to regulate dehiscence in crop plants. (Updated on 16-OCT-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 433
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod of an another in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The pressequence represents a B. napus Sac66 protein putative sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A nucleic acid encoding a signal transduction protein involved in plant dehiscence, useful for producing shatter resistant male sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 6; Fig 15; 71pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wyatt

                                                                                                                                                                                                                                                                                                                                                                              During early ripening of peaches, tissue firmness decreases slowly and compressively. Towards the end of ripening, loss of tissue firmness is capid. This second stage of softening is called the "melting" stage. Compide the peach varieties used for caming do not have a "melting" phase confusion. Ripe fruit remain relatively firm and maintain their shape throughout processing. Fruit of "melting" varieties show an increase in cathvity of endopolygalacturonase (Endopa) during ripening. Complete through its action on intercellular and cell wall pectins. The sequence can be used to manipulate plants of the Rosaceae family, especially peach or prunus to either prevent or enhance capression of PG. The sequence can also be used in efficient breeding programmes. See also ARA48675, ARA48676. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)

It was used to isolate the PG promoter in the construction of a vector encoding antisense RNA to the PG cDNA and PG gene. This would be useful to regulate the expression of the fruit softening enzymes in flowering and fruiting plants. Such antisense RNA would delay fruit softening. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

(PG)

enzyme

540 54 C

```
The invention provides a new method for modifying pectin that involves CC providing a host having pectin methylesterase (PME) activity and CC polygalacturonase (PG) activity, transforming the host by silencing PG CC activity to provide an increased PME to PG ratio, preparing a PME extract CC PME modified pectin is useful for foodstuffs preparation, and to impart CC an increased functionality to food products such as yogurt, milk/fruit CC juice and whey drinks. PME is useful to reduce the number of ester groups CC in a pectin in a block-wise manner, and to de-esterify two or more CC adjacent galacturonic acid residue of a pectin on at least substantially CC sequence of pTOM6 encoding a PG enzyme. A nucleotide sequence (seq Id No. 3) encoding the PG enzyme which is deposited as pTOM23 with NCIMB CC is not provided in the senerification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                  This cDNA clone, encoding polygalacturonase (PG), is used to produce antisense mRNA (with an inverted sequence to that of PG mRNA) which is inserted into a vector used to transform plants which thereafter have altered ripening properties. The inverted sequence and the PG mRNA form double-stranded structure which inhibits expression of the PG mRNA. See also AAN80488. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                       (ICIL )

```
The present invention relates to an improved method for inhibiting the CC expression of a target gene in a cell, by expressing in the cell an CC expression cassette comprising a promoter operably linked to a sense or CC entitled in the cell an inverted repeat (IR) of a subsequence of the targeting sequence having substantial identity to a subsequence CC of the target gene, and an inverted repeat (IR) of a subsequence of a NOS CC (nopaline synthase) gene, where the IR is unrelated to the targeting CC (sequence. The expression cassette, pPF-IRN1 is constructed using a CC (s-UTL) is derived from a plant heat shock 70 (hsp70) gene, the tomato CC (s-UTL) is derived from a plant heat shock 70 (hsp70) gene, the tomato CC (polygalacturonase (PO) gene and an IR of the terminator of the CC polygalacturonase (PO) gene and an IR of the terminator of the Expression of endogenous genes and transgenes, e.g. to regulating expression of endogenous genes and transgences, e.g. to regulate CC expression of endogenous plant phenotypes such as disease resistance, if lavour, protein or nutritional characteristics. The improved gene CC effect of regulating gene expression of a selected endogenous gene or transgene. The method is simple and rapid, and is suitable for hightoning the construct can be silenced at the same time, since the initial silencing trigger mediated through the inverted repeat region will apply to castlet a protein and transcripts. The present sequence represents the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reducing the expression of a target gene in a cell, comprises expressing in the cell an expression cassette comprising a promoter operably linked to a sense or antisense targeting sequence and an inverted repeat of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-AUG-2000;

pathogenic infecti bacterial, fungal g at least infection fungal or one gene involved in plant resistance or response for conferring resistance or tolerance to a plant viral infection by determining or detecting plant to

Claim 6; SEQ ID NO 557; 899pp; English

comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression is significantly altered in expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present semicone.

A cDNA clone (AAT33994), designated SAC66, codes for a polygalacturonase (AAW04248) that is expressed specifically in the dehiscence zone (DZ) of oilseed rape cv. Rafal seed pods. Degenerate PCR primers based on multiple sequence alignments of fruit- and pollen-specific polygalacturonases were used to amplify cDNA from the DZ. A PCR fragment (AAT33999) was generated and used to screen a DZ CDNA library, yielding clone SAC66. The gene can be used in transgenic crop plants to regulate pod dehiscence. Antisense sequences reduce or prevent dehiscence and hence loss of seed prior to harvesting. (Updated on 16-OCT-2003 to

cDNA clone X (AAT63603) includes a coding sequence for oilseed rape dehiscence zone (DZ)-selective endopolygalacturonase (PG). DZ cDNA was subjected to PCR amplification using primers (see also AAT63605-08) based on conserved regions of PG amino acid sequences. PG-related clones (see also AAT63609-14) were identified, of which only Ipg35-8 was specific to the DZ. This clone was used to screen a DZ-selective cDNA library prepd. K. Ipg35-8 was also used from the DZ 6 wk after anthesis, yielding clone x. Ipg35-8 was also used to screen a genomic library to identify the DZ-britised in novel chimeric genes to modify the dehiscence properties of transgenic plants, partic. the pod dehiscence properties of E. napus. 25-MAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise os field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Brassica napus Sac66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10-JAN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ22980
                                  The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The press sequence represents the DNA encoding a B. napus Sac66 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Signal transduction protein; dehiscence; male sterile plant; shatter resistance; oilseed rape; Sac66 protein; ss.

                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rice

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying at least one gene involved in plant resistance or respathogenic infection for conferring resistance or tolerance to a bacterial, fungal or viral infection by determining or detecting

The polygalacturonase gene promoter is active in at least the breaker through red fruit stage in tomato fruit, and can be used in a novel method of the invention for producing a plant with an altered phenotype. In this method, regulatory regions from genes expressed during a particular developmental stage or in a specific tissue are identified by cDNA screening. The regulatory regions are manipulated for use with foreign sequences for introduction into plant cells to provide transformed plants having a phenotypic property that can be modulated. The invention is exemplified with light, seed and fruit-specific promoters. Transformation without gall formation of cells which are not Agrobacterium hosts, especially cereals and legumes, is achieved. (Updated on 25-MAR-2003 to correct PF field.)

This is the nucleotide sequence of a tomato polygalacturonase genomic DNA Clone isolated from a genomic library by screening with polygalacturonase CDNA. The polygalacturonase gene promoter is active in at least the CC breaker through red fruit stage in tomato fruit, and can be used in a CC breaker through red fruit stage in tomato fruit, and can be used in a CC phenotype. In this method, regulatory regions from plant genes (and T-DNA CC and Ti or Ri plasmids) are manipulated for use with foreign sequences for introduction into plant cells to provide transformed plants having a CC phenotypic property that can be modulated. The invention is exemplified CC with light, seed and fruit specific promoters. Also claimed are methods CC with light, seed and fruit specific promoters. Also claimed are methods CC tissue, modifying the genotype of a plant to impart a desired characteristic to fruit, modifying transcription in fruit tissue, and CC expressing a heterologous DNA sequence of interest specifically in fruit CC tissue. The method provides transformation without gall formation in CC plants which have historically not been Agrobacterium hosts. (Updated on CC 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CHILD, Robin
VAN ONCKELIN, Henri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ULVSKOV,
                                                                                                                                                                                                                                                                                             Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Location 95-163 = region encoding the presumed endo-PG signal peptide.

Location 884-900 = region of the endo-PG cDNA corresponding to oligonucleotide PG3

Location 1059-1073 = region of the endo-PG cDNA complementary to oligonucleotide PG2

Location 1229-1245 = region of the endo-PG cDNA complementary to oligonucleotide PG2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              napus
